49. (Previously Presented) For use in a Radio Access Network of a telecommunications system, a method comprising deriving control parameters for controlling an in-and-out-of-synchronization detection algorithm for a radio link set from corresponding cell based parameters, the radio link set being a set of radio links which are combined in a softer handover operation performed at a base station of the Radio Access Network;

wherein the control parameters for controlling the in-and-out-of-synchronization detection algorithm for the radio link set are derived from the corresponding cell based parameters of the cells of the individual Radio Links of the radio link set;

~~A method according to claim 47,~~ wherein the control parameters are derived by taking the lowest value of the corresponding cell based parameters.

50. (Previously Presented) For use in a Radio Access Network of a telecommunications system, a method comprising deriving control parameters for controlling an in-and-out-of-synchronization detection algorithm for a radio link set from corresponding cell based parameters, the radio link set being a set of radio links which are combined in a softer handover operation performed at a base station of the Radio Access Network;

wherein the control parameters for controlling the in-and-out-of-synchronization detection algorithm for the radio link set are derived from the corresponding cell based parameters of the cells of the individual Radio Links of the radio link set; and,

wherein the control parameters are derived by taking a weighed or non-weighed average value of the corresponding cell based parameters.

70. (Previously Presented) A radio access network of a telecommunications system comprising:

an in-and-out of synchronization detector which judges reception quality of a connection with a mobile user equipment unit;

a control parameter determination function which determines control parameters to be utilized by the in-and-out of synchronization detector, the control parameter determination function determining the control parameters for a radio link set from corresponding cell based parameters, the radio link set being a set of radio links which are combined in a softer handover operation performed at a base station of the Radio Access Network;

wherein the control parameter determination function derives the control parameters for controlling the in-and-out-of-synchronization detector for the radio link set from the corresponding cell based parameters of the cells of the individual Radio Links of the radio link set; and,

wherein the control parameters are derived by taking the lowest value of the corresponding cell based parameters.

71. (Previously Presented) A radio access network of a telecommunications system comprising:
